

FABRIPASS

DIGITAL PRODUCT PASSPORT

WORKING PLATFORM GUIDE / 2026

A clear, step-by-step guide to the FabriPass website

Create garment records, add a public product photo, review readiness, publish a sanitized Live Demo sample, generate a QR and record a checkpoint from another phone.

For garment factory owners, merchandisers, compliance teams, sourcing teams and buyers.

READ THIS FIRST

The platform is a working prototype. Readiness measures completeness for internal review. It is not an EU certificate, authenticity proof or GPS tracking service.

The website has three connected experiences.

Use the landing page to explain the concept, the Live Demo to prove the scan-and-track flow, and the signed-in workspace to create private factory records.

AREA	WHO CAN OPEN IT	WHAT IT DOES
Landing page	Public Site visitors	Explains the garment scenario, product anatomy and pilot value.
Live Demo	Public Site visitors	Shows sample products, product QR codes and shared checkpoint history.
Workspace	Signed-in users	Stores private product records, suppliers, buyer assignments, evidence and reviews.
Resources	Public Site visitors	Explains workflow, trust boundaries, pilot steps, privacy and prototype terms.

PUBLIC AND PRIVATE

Product photos uploaded in the workspace are deliberately public in the sanitized Live Demo. Buyer names, supplier identities, internal notes and evidence files remain private.

Recommended demonstration order

01

Open the landing page

Start with the exploded garment. Select the magnifying-glass QR to enter Live Demo.

02

Run the two-device scan

Keep the demo open on a laptop. Scan the QR with a phone and confirm a checkpoint.

03

Show the workspace

Sign in, create or edit a product, add an optional photo and review the readiness gaps.

Explain the value in under two minutes.

The landing page is designed for a first buyer conversation. Its job is to make the workflow understandable before the detailed records appear.

01

Start with product anatomy

The exploded blazer shows that a garment record can describe shell, lining, interlining, trims and labels as connected parts of one product story.

02

Open the QR lens

Select the magnifying glass over the QR. It takes you directly to the Live Demo.

03

Review the four platform blocks

Explain one product record, evidence with context, a visible journey and a scan that connects.

04

Use the garment scenario

Walk through Factory QC, Packing, Dispatch and Buyer received. These are demo checkpoint events, not verified logistics milestones.

05

Open buyer resources

Use Resources for the trust boundary, data dictionary, pilot plan, privacy notice and prototype terms.

06

Use the pilot form

Enter authorized business information only. The form stores the inquiry for a discussion; it does not send email or book a meeting.

PRESENTATION TIP

Lead with a real buyer request your team receives today. Show where FabriPass would hold each fact and which evidence would support it.

Scan on one phone. Watch the event on another.

The demo creates a session in the URL, generates a product QR and polls the shared history every five seconds.

01

Open Live Demo on the main screen

A session parameter is added to the browser URL. Save the full URL if you want to return to the same event history.

02

Choose a garment

Select one of the built-in samples. When signed in, your newest workspace products appear first as sanitized samples.

03

Inspect the product record

Confirm style, batch, composition, origin, quantity, fabric description and care text. A workspace photo appears above the facts when one has been uploaded.

04

Scan the QR

Open the phone camera and scan. If scanning is unavailable, select Copy link and open the link on the second device.

05

Confirm a checkpoint

Choose Factory QC, Packing, Dispatch or Buyer received. Select Confirm demo check-in.

06

Watch the history update

The main screen refreshes within five seconds. Each event includes checkpoint, product, unique event ID and server timestamp.

07

Export or restart

Download the event history as JSON or select New demo session for a separate history.

WHAT A SCAN PROVES

The working flow proves URL resolution, user confirmation, server storage and shared history. It does not prove physical possession, GPS movement, origin, authenticity or certification.

Build a usable garment record.

Sign in before opening Workspace. Sample records remain visible when signed out, but only authenticated workspaces can save products.

01

Select New product

The product interface opens in the centre of the screen and stays within the browser height.

02

Enter identity

Add product name and style code. Add batch, internal buyer assignment, manufacturing facility, country, category and quantity.

03

Add a product image

Choose JPG, PNG or WebP up to 5 MB. The form marks this image as public because it appears in the Live Demo. Do not upload confidential artwork.

04

Complete fibre composition

Add one or more fibres. The percentages must total exactly 100 before the record can save.

05

Map supply stages

Enter supplier and country for Fibre and yarn, Fabric formation, Dyeing and finishing, and Garment making.

06

Add care and circularity guidance

Write clear care, repair, reuse and end-of-life guidance that your team can support.

07

Keep internal notes private

Internal notes stay outside the Live Demo and passport preview.

08

Save product

FabriPass saves the private record, uploads the optional public photo, recalculates readiness and makes a sanitized QR record available in Live Demo.

IF THE PHOTO FAILS

The product record can save before the image upload. Reopen the product, choose the image again and save. The error message states when this partial save occurs.

Make missing support visible before sharing.

Readiness is a simple eight-part completeness model. Each check has equal weight.

01	Product identity and style code
02	Batch and production quantity
03	Manufacturing facility and country
04	Material composition totals 100%
05	Four supply-chain stages identified
06	Care and repair information
07	Reuse and end-of-life guidance
08	Current evidence internally reviewed

Add evidence

- 01 Open Evidence library**
 Select Add evidence and choose the product the document supports.
- 02 Classify the file**
 Choose Material test, Supplier declaration, Transaction certificate, Facility certificate or Other. Add an expiry date when applicable.
- 03 Upload the original**
 Accepted formats are PDF, PNG and JPEG up to 10 MB. The uploaded file remains private.
- 04 Review its scope**
 Check authenticity, validity, product linkage and scope. Mark reviewed only when your internal process is complete.
- 05 Expect review reset after product edits**
 Changing a product creates a new revision and conservatively resets linked review states.

READINESS IS NOT VERIFICATION

A full score means the eight required pieces are present for internal review. Responsible teams must still verify accuracy, legality and evidence scope.

Share a useful sample without exposing factory detail.

The Live Demo mapping deliberately selects a small public subset from a signed-in product record.

PUBLIC LIVE DEMO	PRIVATE WORKSPACE
Product name, style code and batch	Buyer assignment
Category and composition	Facility and supplier identities
Country of manufacture and quantity	Internal notes
Care instructions	Evidence files and review details
Optional product photo	Full private workspace activity
Demo checkpoint events	Private passport and evidence routes

PRODUCT PHOTO RULE	The product image is public by design after upload. The form, Live Demo notice and Resources page all state this boundary. Use approved sample imagery only.
---------------------------	--

Privacy in the demo

- Do not enter personal or confidential information in demo checkpoints.
- The application does not request GPS location or access a camera feed.
- A phone camera reads the QR and opens a normal web link.
- Anyone with the session link and Site access can view or add demo events.
- Formal retention, deletion, support and processing terms must be agreed before commercial onboarding.

Fast checks for a smooth client demonstration.

SYMPTOM	WHAT TO DO
Product form appears off-screen	Reload the latest release. The dialog should open fixed in the centre. On mobile it uses nearly the full viewport.
Workspace product is not in Live Demo	Confirm you are signed in, save the product, then reload Live Demo. Signed-out visitors see built-in samples only.
Photo does not appear	Reopen the product, choose a JPG, PNG or WebP under 5 MB, save, then reload Live Demo.
Phone cannot scan the QR	Use Copy link, send it to the phone and open it in the browser.
Checkpoint does not appear	Confirm the phone submitted the form, keep the same session URL, wait five seconds and reload.
Charts look empty	Confirm products are visible in the workspace. The charts use current product readiness values.
Evidence cannot be reviewed	Confirm the file exists, is not expired and belongs to the current product revision.
You see sample records only	Select Sign in to save. Private workspace APIs require an authenticated session.

DEMO CHECKLIST

Use two charged devices, keep the laptop session URL open, allow five seconds for refresh, and prepare one approved product image before the meeting.

A practical 10-minute buyer walkthrough.

Use this structure to keep the conversation focused on operational value and trust.

01

Minute 0-2: frame the problem

Explain one repeated buyer data request and where the source information currently lives.

02

Minute 2-4: show product anatomy

Use the exploded garment to explain identity, materials, components, evidence and traceability.

03

Minute 4-7: run the live scan

Choose a product, scan with a phone, confirm a checkpoint and show it appear on the laptop.

04

Minute 7-9: open the workspace

Show the product photo, private buyer and supplier fields, readiness score and evidence library.

05

Minute 9-10: agree a pilot question

Choose one factory, one buyer and one measurable workflow to test over the proposed six weeks.

Questions to ask

- Which garment facts are requested most often?
- Which source documents support those facts?
- Who owns each field inside the factory?
- What may be shared with a buyer, and what must remain private?
- What would make a six-week pilot worth continuing?

FINAL MESSAGE

FabriPass gives the team a working place to assemble the record, see missing support, share a controlled sample and demonstrate a real QR checkpoint flow.

End of manual - version prepared for the FabriPass prototype release.
