

From first click to a saved garment check-in

A simple, step-by-step manual for garment owners, factory teams, buyers and decision makers.

Fastest way to understand LoomPass

1. Open the live demo on a laptop.
2. Scan a product QR with a phone.
3. Choose a checkpoint and confirm.
4. Watch the laptop history update.

The QR opens the demo URL. No app installation is required.

Four places, four clear jobs

Use this map to choose where to go. The public pages work without sign-in. The private workspace asks you to sign in before saving factory records.

Home

Understand the value, garment workflow and pilot purpose. Use the main menu to move anywhere.

Live demo

Generate a sample product QR and show a saved checkpoint moving from a phone to the dashboard.

Resources

Read the product overview, pilot process, data definitions, privacy note and prototype terms.

Workspace

Sign in to create products, upload evidence, review readiness and export product information.

Public versus private

The landing page, resources and sample demo are public. Factory product and evidence records are tied to the signed-in user and protected by the private workspace APIs.

Main website address

<https://loompass-garment-readiness.iratul825.chatgpt.site>

Start with the buyer story

The landing page is built for a quick sales conversation. Read it from top to bottom or jump directly to the working demo.

1

Use the top menu

Select Platform for the core capabilities, Live demo for the QR workflow, Resources for documents, User manual for this guide, or Workspace for saved factory records.

2

Open the live prototype

Choose Try scan & track. The demo creates a unique session in the browser address so activity can be shared across two devices.

3

Review the garment scenario

Follow the factory QC, packing, dispatch and buyer received sequence. These are sample checkpoints that show the workflow.

4

Open supporting material

Use Resources to review what works today, the proposed pilot steps, field meanings, data-use notes and prototype limits.

5

Register interest

Complete the pilot inquiry form with authorized business information. A reference appears after the record is saved. The prototype does not send an email.

Useful meeting flow

Start with the garment card, show the two-device QR demo, then finish with the resource centre and pilot form.

Prepare the laptop dashboard

Use a laptop, desktop or tablet as the main screen. Keep this page visible while the second device checks in.

1

Open Live demo

Select Live demo from the menu. Wait until the status says the shared tracking is connected.

2

Keep the session URL

A unique session code is added to the address. Save or bookmark this complete URL if you want to return to the same demo history.

3

Choose a sample garment

Select Everyday cotton tee, Classic denim shirt or Pique polo. The selected card changes colour and the product facts update.

4

Show the QR

The dashboard generates a QR for the selected product and session. Leave it on screen at a comfortable brightness.

5

Use the backup link if needed

If a phone cannot scan the QR, choose Copy link and send or open that URL on the phone. Open check-in can also test the flow on the current device.

Session rule

Each new demo session has its own event history. Switching products keeps the same session but filters the history to the selected product.

Scan, choose, confirm

Any modern phone camera can open the QR link. The phone does not need to sign in for this sample demo.

1

Open the phone camera

Point it at the QR on the laptop. Tap the website notification that appears.

2

Confirm the product

The check-in screen shows the sample garment name, style or batch details and the demo notice. Make sure it matches the product selected on the laptop.

3

Choose a checkpoint

Select Factory QC, Packing, Dispatch or Buyer received from the list.

4

Save the event

Tap Confirm demo check-in once. A success message appears with the saved checkpoint.

5

Return to the laptop

The tracking history refreshes automatically within about five seconds. The newest event appears first.

What gets saved

The demo stores the session, sample product ID, selected checkpoint, unique event ID and server timestamp. It does not request GPS location, camera access or personal details.

Use the history during a meeting

The tracking panel is a shared, saved view of the submitted sample events.

1

Select the product

Choose the same sample garment used on the phone. The history shows events for that product in the current session.

2

Read the newest event

Check the checkpoint name and the time shown in your device's local time. Repeat the scan to demonstrate another handover.

3

Test persistence

Reload the laptop or phone. The previously saved events remain attached to that session.

4

Export the session

Choose Export history to download a JSON file containing the three sample products and all events in the current session.

5

Start fresh

Choose New demo session to create a separate session. Earlier sessions are not deleted; they remain available through their original URLs.

Interpretation

A demo check-in proves that a user submitted a checkpoint to the shared session. It does not prove authenticity, physical possession, GPS movement, delivery or certification.

Build a buyer-ready product record

Open Workspace from the menu. You can explore the interface first; sign in when you want to save your own factory records or upload evidence.

Overview

See product count, average readiness, evidence waiting for review and recent workspace activity.

Products & passports

Create or edit garment records, materials, origin, care guidance and supply stages.

Evidence library

Upload supporting documents, link them to a product and record review or expiry details.

Supply network

Review the declared fibre, mill, processing and garment stages for each product.

1

Sign in to save

Choose Sign in to save and complete the ChatGPT sign-in flow. You return to the workspace afterwards.

2

Create a product

Choose New product. Complete the garment identity, quantity, origin, materials, care guidance and supplier stages.

3

Add evidence

Open Evidence library or a product's Evidence tab. Upload an authorized file and record what it supports.

4

Check readiness

Open the Readiness tab. Resolve each visible missing item before preparing information for a buyer.

Move from internal record to review

LoomPass separates internal product work from information prepared for another person.

1

Open a product

Choose a garment from Products & passports. Review Details, Evidence and Readiness before sharing anything.

2

Preview the passport

Open Passport preview to see the consumer-facing view. Buyer names, supplier evidence files and internal notes are excluded from that preview.

3

Open the passport and QR

Use Open passport & QR to view the private product passport. Site access and sign-in are required for this pilot surface.

4

Download structured data

Use Download passport JSON or the available CSV and JSON exports when you need a machine-readable record for review.

Before commercial use

Agree team roles, buyer access, security review, backup and recovery, retention, stable identifiers, publication controls, support and final regulatory mappings.

Good working practice

Use one product and batch as the first complete example. Link only documents you are authorized to use. Treat readiness as an internal completeness check, not proof of legal conformity or independent certification.

Quick troubleshooting

Most issues can be resolved with the checks below.

Phone does not recognize the QR	Increase screen brightness, move the camera farther away, or use Copy link and open the link on the phone.
Check-in does not appear	Confirm the phone showed a success message. Wait five seconds, select the correct product, then reload the laptop page.
Tracking says unavailable	Check the internet connection and leave the page open. It retries automatically. Do not submit repeatedly while the first save is pending.
Workspace changes do not save	Use Sign in to save. After sign-in, return to Workspace and try again.
A document cannot be uploaded	Confirm you are signed in, the file type is allowed, and the file contains no unauthorized or sensitive information.
You need a clean demonstration	Choose New demo session. Keep the new laptop URL and scan its newly generated QR.

Need to explain the prototype in one sentence?

LoomPass organizes garment data and evidence, then uses a product QR to demonstrate a saved checkpoint moving between two devices.

A confident five-minute presentation

Use this checklist before showing LoomPass to a garment owner, buyer or sourcing team.

1

Before the meeting

Open the live demo on a laptop, confirm the tracking status is connected, and keep a phone ready.

2

Show the problem

Explain that product data, supplier details and evidence often sit in separate places.

3

Show the record

Select a sample garment and point out the style, batch, composition, origin and order details.

4

Show the handover

Scan the QR, choose Dispatch or Buyer received, confirm, and watch the event reach the laptop.

5

Set expectations

Explain that demo events are self-reported and that commercial controls must be agreed before production use.

6

Close with action

Open Resources, share this manual, and use the pilot inquiry form to record the use case.

You are ready

Open the live demo, keep this manual nearby, and let the QR check-in tell the garment story.
